

Thought note for back-end module 4:

I am glad to share that I have completed my back-end module assignment 4. In this assignment, I have created front-end for a “**sales application**” using **React**, **Bootstrap**, **google fonts**, and **font-awesome**.

Folder description:

The submitted folder contains a folder named “**Front-end/sales-app**” which contains whole folder structure created using “**npx create-react-app**” command. Description for the main folders is given below:

1. **Public:** This folder contains a file named “**index.html**” which includes all the links such as bootstrap links, font-awesome link, and google fonts link.
2. **Src:** This is the folder which includes most of the code for front-end of the application.
3. **Components:** This folder comes under “**src**” folder and contains all the different components of the application like **NavBar.js**, **Home.js**, **Login.js**, **Register.js**, **AddSales.js**, **TopSales.js**, and **Revenue.js**.

All the components mentioned above are imported in **App.js** file. To include **google fonts** using CSS, I have used **App.css** file.

To make the folder structure look clean, I have removed almost all the unnecessary files which were created during the process.

Extras:

I have included one extra component named **Home.js** which is used as a cover page for the application to make it look better.

Conclusion:

I have tried my level best to make the front-end as given in the problem Statement PDF. I have also added one more component to make my application look better.

Thank you,
Astitva Bartaria
