Thought note for back-end module assignment 6:

I am glad to share that I have completed my back-end module assignment 6. In the assignment, I have used **React**, **bootstrap**, and **font-awesome** to make the home page of a e-commerce website.

Folder description:

The submitted folder contains a folder named "**e-commerce-homepage**" which is created using "**npx create-react-app**" command. This folder contains 2 separate folder named "**public**" and "**src**".

1. **Public**: This folder contains a main file named "**index.html**" which is rendered on the browser.
2. **Src**: This folder contains 2 other folder named "**components**" and "**images**", and files named "**App.js**", "**App.css**", and "**index.js**".

   - **Components**: This folder contains all the react components. They are: "**home.js**", "**Header.js**", "**Footer.js**", "**Homecover.js**", and "**Slider.js**".
   - **Images**: This folder is empty as I have **used image URL** directly in my code rather than downloading the image.
   - **App.css**: This file contains all the css code for the home page.

Working:

Enter the following commands to run the app:

1. **cd e-commerce-homepage**
2. **npm i**
3. **npm start**

Conclusion:

I've dedicated significant effort into ensuring that my application aligns with the specifications provided in the problem statement PDF. I have created all the necessary components and also included font-awesome as described in the PDF.

Thank you,
Astitva Bartaria
